(1) Gather a sharp pair of scissors and two plastic soda bottles that have been rinsed clean. (2) Cut one bottle at its neck, just before it the bottle widens (this will be the top of your terrarium). Cut the bottom from the second bottle so that you have at least a 4-inch deep bowl (this will be the bottom). (3) Add ½” pea gravel or other material in the bottom to create space for extra water to collect.

6

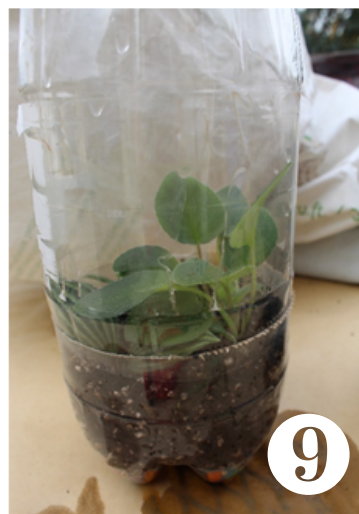

(4) Cut a paper coffee filter to fit inside the base over top of the pea gravel. This will keep your potting soil from mixing in. (5) Add moist potting soil to the bottom. (6) Prepare 3 to 5 small plant cuttings.

9

(7) Stick the plant cuttings into the moist potting soil. (8) Carefully place the top of the terrarium over the plants and into the potting soil. It should tuck inside of the terrarium bottom. (9) Your terrarium is complete! Place in a spot with bright but indirect light. Moisture will condense on the sides within a few hours. Enjoy! As your plants root in and grow, you will need to transfer them to a larger container.
